Regime-Aware Physiological Monitoring

Daily physiological signals from Oura Ring (HRV, resting HR, sleep efficiency, readiness) over 130 days.

Two regime boundaries were detected by PELT change-point analysis: HRV shifted on Dec 27, 2025; resting HR shifted on Feb 27, 2026. Sleep efficiency and readiness score remained stationary across the same window. Within-regime baselines are computed against each period's own mean and SD rather than a rolling global mean.

The table and callout above show the quantitative regime deltas and the detection latency gap between PELT and a naive rolling mean.

Detection Latency — PELT vs. Rolling Mean

Signal	Regime shift date	Rolling mean detection lag	Outcome
HRV	Dec 27, 2025	7 days	Detected late
Resting HR	Feb 27, 2026	Never detected	Missed entirely

2 rows

Regime Summary — Mean, SD, Range per Period

Signal	Period	Mean	SD	Min	Max
HRV (ms)	Baseline (through Dec 27)	81.16	12.51	24	94
HRV (ms)	Post-travel (Dec 28+)	67.63	7.14	47	83
Resting HR (bpm)	Marathon training (Feb 28+)	44.14	2.25	39	48
Resting HR (bpm)	Pre-training (through Feb 27)	48.68	4.08	43	76
